

## TECHNICAL INFO N° 6

### RECOMMENDATIONS ON ADHESION

Always apply the self-adhesive above the minimum application temperature and ensure its use within the recommended temperature range.

Avoid using too rigid face materials on small radius curved surfaces.

Some demolding agents used in the plastic container manufacturing process can drastically reduce the adhesion performance of the adhesive.

Adhesion performance is reduced on low surface tension substrates such as polyethylene or polypropylene.

Removable adhesives have performances that can be affected by the kind of substrate they are applied on. Besides damaging the substrate, subsequent removal could be difficult. This is especially important for reclosable end-users, but also for any removable application.  
**THEREFORE TRIALS ARE RECOMMENDED.**
